

## SECURITY PACK

IRIS Instruments propose a security pack to help making the study area completely safe for the users and for the public.

It features traffic cones stamped with "High Voltages" labels that can be used to cover the injection electrodes to prevent people from touching them during the injection.

To warn the public from touching the electrodes, cables and instruments, position "Caution Electrical Hazard" warning plates on public pathway and near the instruments.

To protect the user(s), think about your personal protective equipment. IRIS Instruments recommend at least to use isolating shoes, isolating gloves and protective mask. This list is not exhaustive and may change according to your country.

**These accessories may be not sufficient to comply with the law. In any case, make sure to comply with all applicable local and national laws of the jurisdiction of using of the device**
